

Rules Table verdict: mixed results, no stable incremental benefit established

Dynamics Atlas · 10 September 2026 · 74 completed outputs · \$1.20292179

Keep scientific questions, a short analysis protocol, mature tools and traceable reports at the centre of the project. Retain the source-linked rule library. Pause expansion of the selector and generic conclusion checker.

Component	Observed result	Decision
Explicit subquestions	Coverage rose from 2 to 2.5/3 for HSP90 and 2 to 3/3 for ADK; no additional overclaims. HSP90 total errors rose from 1 to 2.	Keep as a way to clarify required outputs; coverage is not uniformly better accuracy.
Admission card	Defect detection and answer downgrading were 0/4 with or without the card. All four card runs listed but never read it.	Apply admission during preparation; file availability did not deliver the warning.
Retrieved method cards	HSP90 correct-unit medians: protocol 4.5, full rules 2, cards 2.5. Q05: 4.5, 5, 4.5.	Cards failed the two-case non-inferiority criterion. Preserve the Q05 full-rule benefit as part of the mixed result.
One feedback round	Only 1/3 questions met the group criterion. No feedback run reduced its initial core-error count; 0/9 warnings identified a core scientific error.	Current checker did not establish useful correction.

Scientific progress. HSP90 movement toward an open direction was separated from agreement with native NOE references. DHFR local-distance differences were reproduced after correcting periodic coordinates. ADK domain descriptors were cross-checked against GROMACS; neither apo trajectory showed joint endpoint-window closure. These are bounded scientific results, not proof of Rules-mediated improvement.

Evidence limits. Conditions had four runs per question. Most materials were exposed development cases; ADK was one new source group. Scores were sealed before label unblinding, but the scorer also curated the cases. Independent domain review and human correction-time measurement remain outstanding.
